# A New Method to Attribute Reduction of Decision Systems with Covering Rough Sets 

Nguyen Duc Thuan ${ }^{1}$, Nguyen Xuan Huy ${ }^{2}$<br>${ }^{1}$ Department of Information Systems, Nhatrang University, Vietnam ngducthuan@gmail.com<br>${ }^{2}$ Institute of Information Technology, Vietnamese Academy of Science and Technology nxhuy564@gmail.com

#### Abstract

Attribute reduction is an important issue of rough set theory. It has been proven that finding the minimal reduct of an information system is a NP-hard problem, so is finding the minimal reduct of an incomplete information system. Main reason of causing NP-hard is combination problem. In this paper, we theoretically study an attribute reduction algorithm. It based on results of Chen Degang et al in consistent and inconsistent covering decision system. The time complexity of this algorithm is $O(|\Delta||U| 2)$. An illustrative example is provided that shows the application potential of the algorithm

Keywords: attribute reduction, family of covering rough sets, consistent covering decision system, inconsistent covering decision system Introduction

## 1. Introduction

Rough set theory is a mathematical tool to deal with vagueness and uncertainty of imprecise data. The theory introduced by Pawlak in 1982 has been developed and found applications in the fields of decision analysis, data analysis, pattern recognition, machine learning, and knowledge discovery in databases. While the equivalence relation is too harsh to meet and is extended to tolerance relation and similarity relation. For example, equivalence relation can't be established based on the null value of attribute. In incomplete information systems, which relations are established can be the base of further study for rough computation, knowledge reduction and rule extraction. On this basis, the covering theory of the generalized rough set is study deeply.
Cheng Degang et al. [1] have defined consistency and inconsistency covering decision system and their attribute reduction. They gave an algorithm to compute reducts from decision systems. Their method based on discernibility matrix. But, sometime we only need to find an attribute reduction. So we propose an algorithm which is finding a minimal attribute reduct of incomplete information decision system.

## 2. Some relevant concepts and results

In this section, we first recall the concept of a cover and present an example suitable for covering rough sets, and then review the existing research on covering rough sets. Finally, propose the definition of induced cover and reveal three basic relations between two objects with respect to the induced cover.

One kind of suitable data set for covering rough sets is the information systems that some objects have multiple attribute values for a given attribute. This kind of data set is available when some objects have multiselections of attribute values for a given attribute. So we have to list all the possible attribute values. One example of this kind of data set is the combination of several information systems. This is illustrated with the following example.

Example 2.1 ([1]) Let us consider the problem of evaluating credit card applicants. Suppose $\mathrm{U}=\left\{\mathrm{x}_{1}, . ., \mathrm{x}_{9}\right\}$ is a set of nine applicants, $\mathrm{E}=\{$ education; salary $\}$ is a set of two attributes, the values of 'education'" are \{best; better; good\}, and the values of "salary" are \{high; middle; low\}. We have three specialists $\{A, B, C\}$ to evaluate the attribute values for these applicants. It is possible that their evaluation results to the same attribute values may not be the same, listed below:
For attribute "education"
A: best $=\left\{\mathrm{x}_{1}, \mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}\right\}$, better $=\left\{\mathrm{x}_{2}, \mathrm{x}_{8}\right\}$, good $=\left\{\mathrm{x}_{3} ; \mathrm{x}_{6} ; \mathrm{x}_{9}\right\}$
B: best $=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}$, better $=\left\{\mathrm{x}_{5}\right\}$, good $=\left\{\mathrm{x}_{3}, \mathrm{x}_{6}, \mathrm{x}_{9}\right\}$
C: best $=\left\{\mathrm{x}_{1}, \mathrm{x}_{4}, \mathrm{x}_{7}\right\}$, better $=\left\{\mathrm{x}_{2}, \mathrm{x}_{8}\right\}$, good $=\left\{\mathrm{x}_{3}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{9}\right\}$
For attribute "salary",
A: high $=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}$, middle $=\left\{\begin{array}{lllll} & \left.\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}, \quad \text { low }= & \left\{\mathrm{x}_{9}\right\}\end{array}\right.$
B: high $=\left\{\mathrm{x}_{1}, \quad \mathrm{x}_{2}, \mathrm{x}_{3}\right\}$, middle $=\left\{\begin{array}{llll}\mathrm{x}_{4}, & \mathrm{x}_{5}, & \left.\mathrm{x}_{6}, \mathrm{x}_{7}\right\}, \quad \text { low }= & \left\{\mathrm{x}_{8},\right. \\ \mathrm{x}_{9}\end{array}\right\}$
C: high $=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}$, middle $=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{8}\right\}$, low $=\left\{\mathrm{x}_{7}, \mathrm{x}_{9}\right\}$

Table 1 Classification by evaluation of all three specialists

| Salary | Education |  |  |
| :--- | :--- | :--- | :--- |
|  | Best | Better | Good |
| High | $\left\{\mathrm{x}_{1}, \mathrm{x}_{2}\right\}$ | $\left\{\mathrm{x}_{2}\right\}$ | $\left\{\mathrm{x}_{3}\right\}$ |
| Middle | $\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}$ | $\left\{\mathrm{x}_{5}, \mathrm{x}_{8}\right\}$ | $\left\{\mathrm{x}_{5}, \mathrm{x}_{6}\right\}$ |
| Low | $\left\{\mathrm{x}_{7}, \mathrm{x}_{8}\right\}$ | $\left\{\mathrm{x}_{8}\right\}$ | $\left\{\mathrm{x}_{9}\right\}$ |

Suppose the evaluations given by these specialists are of the same importance. If we want to combine these evaluations without losing information, we should union the evaluations given by each specialist for every attribute value as shown in Table 1. This classification is not a partition, but a cover, which reflects a kind of uncertainty caused by the differences in interpretation of data.

### 2.1. Covering rough sets and induced covers Headings

Definition 2.1 Let $U$ be a universe of discourse, $C$ a family of subsets of $U$. $C$ is called a cover of $U$ if no subset in C is empty and $\cup \mathrm{C}=\mathrm{U}$.

Definition 2.2 Let $\mathrm{C}=\{\mathrm{C} 1, \mathrm{C} 2, . ., \mathrm{Cn}\}$ be a cover of U . For every $\mathrm{x} \in \mathrm{U}$, let $\mathrm{Cx}=\cap\{\mathrm{Cj}: \mathrm{Cj}$ $\in C, x \in C j\} \cdot \operatorname{Cov}(C)=\{C x: x \in U\}$ is then also a cover of $U$. We call it induced over of $C$.

Definition 2.3 Let $\Delta=\{\mathrm{Ci}: \mathrm{i}=1, \mathrm{~m}\}$ be a family of covers of U . For every $\mathrm{x} \in \mathrm{U}$, let $\Delta \mathrm{x}=$ $\cap\{\mathrm{Cix}: \operatorname{Cix} \in \operatorname{Cov}(\mathrm{Ci}), \mathrm{x} \in \mathrm{Cix}\}$ then $\operatorname{Cov}(\Delta)=\{\Delta \mathrm{x}: \mathrm{x} \in \mathrm{U}\}$ is also a cover of $U$. We call it the induced cover of $\Delta$.

Clearly $\Delta_{\mathrm{x}}$ is the intersection of all the elements in every $\mathrm{C}_{\mathrm{i}}$ including x , so for every $\mathrm{x} \in \mathrm{U}, \Delta_{\mathrm{x}}$ is the minimal set in $\operatorname{Cov}(\Delta)$ including $x$. If every cover in $\Delta$ is an attribute, then $\Delta_{\mathrm{x}}=\cap\left\{\mathrm{C}_{\mathrm{ix}}\right.$ : $\left.\mathrm{C}_{\mathrm{ix}} \in \operatorname{Cov}\left(\mathrm{C}_{\mathrm{i}}\right), \mathrm{x} \in \mathrm{C}_{\mathrm{ix}}\right\}$ means the relation among $\mathrm{C}_{\mathrm{ix}}$ is a conjunction. $\operatorname{Cov}(\Delta)$ can be viewed as the intersection of covers in $\Delta$. If every cover in $\Delta$ is a partition, then $\operatorname{Cov}(\Delta)$ is also a partition and $\Delta_{x}$ is the equivalence class including x . For every $\mathrm{x}, \mathrm{y} \in \mathrm{U}$, if $\mathrm{y} \in \Delta_{\mathrm{x}}$, then $\Delta_{\mathrm{x}} \supseteq \Delta_{\mathrm{y}}$, so if $\mathrm{y} \in \Delta_{\mathrm{x}}$ and x $\in \Delta_{\mathrm{y}}$, then $\Delta_{\mathrm{x}}=\Delta_{\mathrm{y}}$. Every element in $\operatorname{Cov}(\Delta)$ can not be written as the union of other elements in $\operatorname{Cov}(\Delta)$. We employ an example to illustrate the practical meaning of $\mathrm{C}_{\mathrm{x}}$ and $\Delta_{\mathrm{x}}$.

Example 2.2 ([1]) In Example 2.1 if let $\Delta=\{\mathrm{C} 1, \mathrm{C} 2\}$, where C 1 denotes the attribute "education" and C2 denotes the attribute "salary", then
$\mathrm{C}_{1}=\left\{\mathrm{C}_{11}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}\right.$ (best), $\mathrm{C}_{12}=\left\{\mathrm{x}_{2}, \mathrm{x}_{5}, \mathrm{x}_{8}\right\}$ (better), $\mathrm{C}_{13}=\{\mathrm{x} 3, \mathrm{x} 5, \mathrm{x} 6, \mathrm{x} 9\}$ (good) $\}$
$\mathrm{C}_{2}=\left\{\mathrm{C}_{21}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}\right.$ (high), $\mathrm{C}_{22}=\left\{\mathrm{x}_{4}, \mathrm{x}_{3}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}$ (middle), $\mathrm{C}_{23}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}$ (lower) $\}$
We have $\mathrm{C}_{1 \mathrm{x} 5}=\left\{\mathrm{x}_{5}\right\}=\mathrm{C}_{11} \cap \mathrm{C}_{12} \cap \mathrm{C}_{13}$, which implies the possible description of $\mathrm{x}_{5}$ is $\{$ (best $\vee$ better $\vee$ good $\}$ according to attribute 'education'". $\Delta_{x 8}=\left(\mathrm{C}_{11} \cap \mathrm{C}_{12}\right) \cap\left(\mathrm{C}_{22} \cap \mathrm{C}_{23}\right)$ which implies the possible description of $\mathrm{x}_{8}$ is $\{($ best $\vee$ better $) \wedge($ middle $\vee$ lower $)\}$.

For every $X \subseteq U$, the lower and upper approximation of $X$ with respect to $\operatorname{Cov}(\Delta)$ are defined as follows:

$$
\begin{gather*}
\Delta(X)=\cup\left\{\Delta_{x}: \Delta_{x} \subseteq X\right\},  \tag{1}\\
\bar{\Delta}(X)=\cup\left\{\Delta_{x}: \Delta_{x} \cap X \neq \varnothing\right\} \tag{2}
\end{gather*}
$$

The positive, negative and boundary regions of X relative to $\Delta$ are computed using the following formulas respectively:

$$
\begin{align*}
& \operatorname{POS}_{\Delta}(X)=\underline{\Delta}(X), N E G_{\Delta}(U-\bar{\Delta}(X), \\
& B N_{\Delta}(X)=\bar{\Delta}(X)-\underline{\Delta}(X) \tag{3}
\end{align*}
$$

Clearly in $\operatorname{Cov}(\Delta), \Delta_{\mathrm{x}}$ is the minimal description of object x .
Theorem 2.1 ([1]) Supposing $U$ is a finite universe and $\Delta=\left\{C_{i}: i=1, . . \mathrm{m}\right\}$ be a family of covers of U , the following statements hold:
(1) $\Delta_{\mathrm{x}}=\Delta_{\mathrm{y}}$ if and only if for every $\mathrm{C}_{\mathrm{i}} \in \Delta$ we have $\mathrm{C}_{\mathrm{ix}}=\mathrm{C}_{\mathrm{iy}}$.
(2) $\Delta_{\mathrm{x}} \supset \Delta_{\mathrm{y}}$ if and only if for every $\mathrm{C}_{\mathrm{i}} \in \Delta$ we have $\mathrm{C}_{\mathrm{ix}} \supseteq \mathrm{C}_{\mathrm{iy}}$ and there is a $\mathrm{C}_{\mathrm{i}} \in \Delta$ such that $\mathrm{C}_{\mathrm{i} 0 \mathrm{x}} \supset$ $\mathrm{C}_{\mathrm{i} 0 \mathrm{y}}$.
(3) $\Delta_{\mathrm{x}} \not \subset \Delta_{\mathrm{y}}$ and $\Delta_{\mathrm{y}} \not \subset \Delta_{\mathrm{x}}$ hold if and only if there are $\mathrm{C}_{\mathrm{i}}, \mathrm{C}_{\mathbf{j}} \in \Delta$ such that $\mathrm{C}_{\mathrm{ix}} \subset \mathrm{C}_{\mathrm{iy}}$ and $\mathrm{C}_{\mathrm{jx}} \supset \mathrm{C}_{\mathrm{jy}}$ or there is a $\mathbf{C}_{\mathbf{i} 0} \in \Delta$ such that $\mathrm{C}_{\mathrm{i} 0 \mathrm{x}} \not \subset \mathrm{C}_{\mathrm{i} 0 \mathrm{y}}$ and $\mathrm{C}_{\mathrm{i} 0 \mathrm{y}} \not \subset \mathrm{C}_{\mathrm{i} 0 \mathrm{x}}$.

### 2.2. Attribute reduction of consistent and inconsistent decision systems

Definition 2.4 ([1]) Let $\Delta=\{\mathrm{Ci}: \mathrm{i}=1, . . \mathrm{m}\}$ be a family of covers of $\mathrm{U}, \mathrm{D}$ is a decision attribute, $\mathrm{U} / \mathrm{D}$ is a decision partition on $U$. If for $\forall x \in U, \exists D j \in U / D$ such that $\Delta x \subseteq D j$, then decision system ( $\mathrm{U}, \Delta, \mathrm{D}$ ) is called a consistent covering decision system, and denoted as $\operatorname{Cov}(\Delta) \leq \mathrm{U} / \mathrm{D}$. Otherwise, ( $\mathrm{U}, \Delta, \mathrm{D}$ ) is called an inconsistent covering decision system. The positive region of D relative to $\Delta$ is defined as

$$
\begin{equation*}
\operatorname{POS}_{\Delta}(D)=\bigcup_{X \in U / D} \Delta(X) \tag{4}
\end{equation*}
$$

Remark 2.1: Let $\mathrm{D}=\{\mathrm{d}\}$, then $\mathrm{d}(\mathrm{x})$ is a decision function $\mathrm{d}: \mathrm{U} \rightarrow \mathrm{V}_{\mathrm{d}}$ of the universe U into value set $V_{d}$. For every $\mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}} \in \mathrm{U}$, if $\Delta \mathrm{x}_{\mathrm{i}} \subseteq \Delta \mathrm{x}_{\mathrm{j}}$, then $\mathrm{d}\left(\mathrm{x}_{\mathrm{i}}\right)=\mathrm{d}\left(\left[\mathrm{x}_{\mathrm{i}}\right]_{\mathrm{D}}\right)=\mathrm{d}\left(\Delta_{\mathrm{xi}}\right)=\mathrm{d}\left(\Delta_{\mathrm{xj}}\right)=\mathrm{d}\left(\mathrm{x}_{\mathrm{j}}\right)=$ $\mathrm{d}\left(\left[\mathrm{x}_{\mathrm{j}}\right]_{\mathrm{D}}\right)$. If $\mathrm{d}\left(\Delta_{\mathrm{xi}}\right) \neq \mathrm{d}\left(\Delta_{\mathrm{xj}}\right)$, then $\Delta_{\mathrm{xi}} \cap \Delta_{\mathrm{xj}}=\varnothing$, i.e $\Delta_{\mathrm{xi}} \not \subset \Delta_{\mathrm{xj}}$ and $\Delta_{\mathrm{xj}} \not \subset \Delta_{\mathrm{xi}}$.

Definition 2.5 ([1]) Let $(\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\})$ be a consistent covering decision system. For $\mathrm{Ci} \in \Delta$, if $\operatorname{Cov}(\Delta-\{\mathrm{Ci}\}) \leq \mathrm{U} / \mathrm{D}$, then Ci is called superfluous relative to D in $\Delta$, otherwise Ci is called indispensable relative to D in $\Delta$. For every $\mathrm{P} \subseteq \Delta$ satisfying $\operatorname{Cov}(\mathrm{P}) \leq \mathrm{U} / \mathrm{D}$, if every element in P is indispensable, i.e., for every $\mathrm{Ci} \in \mathrm{P}, \operatorname{Cov}(\Delta-\{\mathrm{Ci}\}) \leq \mathrm{U} / \mathrm{D}$ is not true, then P is called a reduct of D relative to D , relative reduct in short. The collection of all the indispensable elements in D is called the core of $\Delta$ relative to D , denoted as $\operatorname{Core} \mathrm{D}(\Delta)$. The relative reduct of a consistent covering decision system is the minimal set of conditional covers (attributes) to ensure every decision rule still consistent. For a single cover Ci , we present some equivalence conditions to judge whether it is indispensable.

Definition 2.6 ([1]) Suppose U is a finite universe and $\Delta=\{\mathrm{Ci}: \mathrm{i}=1, . \mathrm{m}\}$ be a family of covers of $\mathrm{U}, \mathrm{Ci} \in \Delta, \mathrm{D}$ is a decision attribute relative $\Delta$ on U and $\mathrm{d}: \mathrm{U} \rightarrow \mathrm{Vd}$ is the decision function Vd defined as $\mathrm{d}(\mathrm{x})=[\mathrm{x}] \mathrm{D} .(\mathrm{U}, \Delta, \mathrm{D})$ is an inconsistent covering decision system, i.e., $\operatorname{POS} \Delta(\mathrm{D}) \neq \mathrm{U}$. If $\operatorname{POS} \Delta(\mathrm{D})=\operatorname{POS} \Delta-\{\mathrm{Ci}\}(\mathrm{D})$, then Ci is superfluous relative to D in $\Delta$. Otherwise Ci is indispensable relative to D in $\Delta$. For every $\mathrm{P} \subseteq \Delta$, if every element in P is indispensable relative to $D$, and $\operatorname{POS} \Delta(D)=\operatorname{POSP}(D)$, then $P$ is a reduct of $\operatorname{POS} \Delta(D)=\operatorname{POS} \Delta-\{\operatorname{Ci}\}(D)$ relative to $D$, called relative reduct in short. The collection of all the indispensable elements relative to $D$ in $\Delta$ is the core of $\Delta$ relative to D , denoted by $\operatorname{CoreD}(\Delta)$.

### 2.3. Some results of Chang et al

Theorem $2.2([1])$ Suppose $\operatorname{Cov}(\Delta) \leq \mathrm{U} / \mathrm{D}, \mathrm{Ci} \in \Delta, \mathrm{Ci}$ is then indispensable, i.e., $\operatorname{Cov}(\Delta-\{\mathrm{Ci}\}) \leq$ $U / D$ is not true if and only if there is at least a pair of $x i, x j \in U$ satisfying $d(D x i) \neq d(D x j)$, of which the original relation with respect to $\Delta$ changes after Ci is deleted from $\Delta$.

Theorem $2.3([1])$ Suppose $\operatorname{Cov}(\Delta) \leq U / D, P \subseteq \Delta$, then $\operatorname{Cov}(P) \leq U / D$ if and only if for $x i, x j \in U$ satisfying $\mathrm{d}(\Delta \mathrm{xi}) \neq \mathrm{d}(\Delta \mathrm{xj})$, the relation between xi and xj with respect to $\Delta$ is equivalent to their relation with respect to P , i.e., $\Delta \mathrm{xi} \not \subset \Delta \mathrm{xj}$ and $\Delta \mathrm{xj} \not \subset \Delta \mathrm{xi} \Leftrightarrow \mathrm{Pxi} \not \subset \mathrm{Pxj}, \mathrm{Pxj} \not \subset \mathrm{Pxi}$.

Theorem 2.4 ([1]) Inconsistent covering decision system ( $\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\}$ ) have the following properties:
(1) For $\forall \mathrm{xi} \in \mathrm{U}$, if $\Delta_{\mathrm{xi}} \subset \operatorname{POS}_{\Delta}(\mathrm{D})$, then $\Delta_{\mathrm{xi}} \subseteq[\mathrm{D}]_{\mathrm{xi}}$; if $\Delta_{\mathrm{xi}} \not \subset \operatorname{POS}_{\Delta}(\mathrm{D})$, then for $\forall \mathrm{x}_{\mathrm{k}} \in \mathrm{U}, \Delta_{\mathrm{xi}} \subseteq\left[\mathrm{x}_{\mathrm{k}}\right]_{\mathrm{D}}$ is not true.
(2) For any $\mathrm{P} \subseteq \Delta, \operatorname{POS}_{\mathrm{P}}(\mathrm{D})=\operatorname{POS}_{\Delta}(\mathrm{D})$ if and only if

$$
\begin{equation*}
\underline{P}(X)=\underline{\Delta}(X) \tag{5}
\end{equation*}
$$

for $\forall \mathrm{X} \in \mathrm{U} / \mathrm{D}$.
(3) For any $\mathrm{P} \subseteq \Delta, \operatorname{POS}_{\mathrm{P}}(\mathrm{D})=\mathrm{POS}_{\Delta}(\mathrm{D})$ if and only if

$$
\begin{equation*}
\forall \mathrm{x}_{\mathrm{i}} \in \mathrm{U}, \Delta_{\mathrm{xi}} \subseteq\left[\mathrm{x}_{\mathrm{i}}\right]_{\mathrm{D}} \Leftrightarrow \mathrm{P}_{\mathrm{xi}} \subseteq\left[\mathrm{x}_{\mathrm{i}}\right]_{\mathrm{D}} \tag{6}
\end{equation*}
$$

### 2.4. Two theorems as a base for new algorithm

Theorem 2.5 Let $(\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\})$ be a covering decision system. $\mathrm{P} \subseteq \Delta$, then we have: a. $(\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\})$ is a consistent covering decision system when it holds:

$$
\begin{equation*}
\sum_{x \in U} \frac{\left|\Delta_{x} \cap[x]_{D}\right|}{\left|\Delta_{x}\right|}=|U| \tag{7}
\end{equation*}
$$

b. Suppose $\operatorname{Cov}(\Delta) \leq U / D, C i \in \Delta, \mathrm{Ci}$ is then indispensable, i.e., $\operatorname{Cov}(\Delta-\{\mathrm{Ci}\}) \leq \mathrm{U} / \mathrm{D}$ is true if and only if

$$
\begin{equation*}
\sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(P_{x i} \cap P_{x j}\right)| | d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right) \mid=0\right. \tag{8}
\end{equation*}
$$

Where $\operatorname{Cov}\left(\Delta-\left\{C_{i}\right\}\right)=\left\{P_{x}: x \in U\right\}, \operatorname{Cov}(\Delta)=\left\{\Delta_{x}: x \in U\right\}$
Proof:
a. By define of a consistent covering decision system, clearly for every $\mathrm{x} \in \mathrm{U}, \Delta_{\mathrm{x}} \subseteq[\mathrm{x}]_{\mathrm{D}}$ is always true, thus we have

$$
\begin{equation*}
\left|\Delta_{x} \cap[x]_{D}\right|=\left|\Delta_{x}\right| \tag{9}
\end{equation*}
$$

i.e

$$
\begin{equation*}
\sum_{x \in U} \frac{\left|\Delta_{x} \cap[x]_{D}\right|}{\left|\Delta_{x}\right|}=|U| \tag{10}
\end{equation*}
$$

b. Let $\operatorname{Cov}\left(\Delta-\left\{C_{i}\right\}\right)=\left\{P_{x}: x \in U\right\}=\operatorname{Cov}(P), \operatorname{Cov}(\Delta)=\left\{\Delta_{x}: x \in U\right.$, by theorem 2.3, $P$ is a reduct or $C_{i}$ is indispensable, for $x i, x j \in U$ satisfying $d(\Delta x i) \neq d(\Delta x j)$, the relation between $x i$ and $x j$ with respect to $\Delta$ is equivalent to their relation with respect to $P$, i.e., $\Delta x i \not \subset \Delta x j$ and $\Delta x j \not \subset \Delta x i \Leftrightarrow P x i \not \subset \mathrm{Pxj}, \mathrm{Pxj} \not \subset \mathrm{Pxi}$. Follow remark 2.1, If $\mathrm{d}\left(\Delta_{\mathrm{xi}}\right) \neq \mathrm{d}\left(\Delta_{\mathrm{xj}}\right)$, then $\Delta_{\mathrm{xi}} \cap \Delta_{\mathrm{xj}}=\varnothing$, i.e

$$
\begin{equation*}
\left|\left(\Delta_{x i} \cap \Delta_{x j}\right) \cup\left(P_{x i} \cap P_{x j}\right)\right|=0 \tag{11}
\end{equation*}
$$

If $x i, x j \in U$ satisfying $d(\Delta x i)=d(\Delta x j)$ then

$$
\begin{equation*}
\left|d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right)\right|=0 \tag{12}
\end{equation*}
$$

In other words, it holds:

$$
\begin{equation*}
\sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(P_{x i} \cap P_{x j}\right)| | \Delta_{x i}-\Delta_{x j} \mid=0\right. \tag{13}
\end{equation*}
$$

This completes the proof.
Theorem 2.6 Let $(\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\})$ be a inconsistent covering decision system. $\mathrm{P} \subseteq \Delta, \mathrm{POS}_{\mathrm{P}}(\mathrm{D})=$ $\operatorname{POS}_{\Delta}(\mathrm{D})$ if and only if $\forall x i \in U$,

$$
\begin{equation*}
\sum_{x i \in U}\left[\left|\frac{\Delta_{x i} \cap\left[x_{i}\right]_{D}}{\Delta_{x i}}\right|-\left|\frac{P_{x i} \cap\left[x_{i}\right]_{D}}{P_{x i}}\right|\right]=0 \tag{14}
\end{equation*}
$$

Proof:
By theorem 2.4, from third condition $\forall \mathrm{xi} \in \mathrm{U}, \Delta \mathrm{xi} \subseteq[\mathrm{xi}] \mathrm{D} \Leftrightarrow \mathrm{Pxi} \subseteq[\mathrm{xi}] \mathrm{D}$ i.e $\forall \mathrm{xi} \in \mathrm{U}$,

$$
\begin{equation*}
\left|\Delta_{x i} \cap[x]_{D}\right|=\left|\Delta_{x i}\right| \Leftrightarrow\left|P_{x i} \cap[x]_{D}\right|=\left|P_{x i}\right| \tag{15}
\end{equation*}
$$

In other words, we have theorem above.

## 3. Algorithm of attribute reduction

In this section, an algorithm of attribute reduction is presented. Theorem 2.5 and 2.6 are theorical foundation for our proposing. This algorithm finds an approximately minimal reduct.
3.1. Algorithm of attribute reduction in covering decision system:

Input: A covering decision system

$$
\begin{equation*}
\mathrm{S}=(\mathrm{U}, \Delta, \mathrm{D}=\{\mathrm{d}\}) \tag{16}
\end{equation*}
$$

Output: One product RD of $\Delta$.

## Method

## Step 1: Compute

$$
\begin{equation*}
C I=\sum_{x \in U} \frac{\left|\Delta_{x} \cap[x]_{D}\right|}{\left|\Delta_{x}\right|} \tag{17}
\end{equation*}
$$

Step 2: If $\mathrm{CI}=|\mathrm{U}|\{\mathrm{S}$ is a consistent covering decision system $\}$ then goto Step 3 else goto Step 5 .
Step 3: Compute

$$
\begin{equation*}
\Delta_{x}, d\left(\Delta_{x}\right), \forall x \in U \tag{18}
\end{equation*}
$$

Step 4: Begin

## for each $\mathrm{C}_{\mathrm{i}} \in \Delta$ do

if

$$
\begin{equation*}
\sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(P_{x i} \cap P_{x j}\right)| | d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right) \mid=0\right. \tag{19}
\end{equation*}
$$

$\left\{\right.$ Where $\left.\Delta-\left\{\boldsymbol{C}_{\boldsymbol{i}}\right\}=\{P x: x \in U\}\right\}$ then $\Delta:=\Delta-\left\{\boldsymbol{C}_{\boldsymbol{i}}\right\}$;

## Endfor;

goto Step 6.
End;

## Step 5: Begin

for each $\mathrm{C}_{\mathrm{i}} \in \Delta$ do
if

$$
\begin{equation*}
\sum_{x i \in U}\left[\left|\frac{\Delta_{x i} \cap\left[x_{i}\right]_{D}}{\Delta_{x i}}\right|-\left|\frac{P_{x i} \cap\left[x_{i}\right]_{D}}{P_{x i}}\right|\right]=0 \tag{20}
\end{equation*}
$$

then $\Delta:=\Delta-\left\{\mathrm{C}_{\mathrm{i}}\right\} ;$
$\left\{\right.$ Where $\left.\Delta-\left\{C_{i}\right\}=\{P x: x \in U\}\right\}$

## Endfor;

End;
Step 6: $\mathrm{RD}=\Delta$; the algorithm terminates.
By using this algorithm, the time complexity to find one reduct is polynomial.
At the first step, the time complexity to compute CI is $\mathrm{O}(|\mathrm{U}|)$.
At the step 2, the time complexity is $\mathrm{O}(1)$.
At the step 3, the time complexity is $\mathrm{O}(|\mathrm{U}|)$.
At the step 4, the time complexity to compute $\sum \Sigma()$ is $\mathrm{O}\left(|\mathrm{U}|^{2}\right)$, from $\mathrm{i}=1 . .|\Delta|$, thus the time complexity of this step is $\mathrm{O}\left(|\Delta||\mathrm{U}|^{2}\right)$,
At the step 5, the time complexity is the same as step 4. It is $\mathrm{O}\left(|\Delta||\mathrm{U}|^{2}\right)$.
At the step 6, the time complexity is $\mathrm{O}(1)$.
Thus the time complexity of this algorithm is $\mathrm{O}\left(|\Delta \| \mathrm{U}|^{2}\right.$ ) (Where we ignore the time complexity for computing $\left.\Delta_{\mathrm{xi}}, \mathrm{P}_{\mathrm{xi}}, \mathrm{i}=1 . .|\Delta|\right)$.

## 4. Illustrative Example

Suppose $\mathrm{U}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, . ., \mathrm{x}_{9}\right\}, \Delta=\left\{\mathrm{C}_{\mathrm{i}}, \mathrm{i}=1 . .4\right\}$, and

$$
\begin{aligned}
& \mathrm{C}_{1}=\left\{\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\},\left\{\mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}\right\}, \\
& \mathrm{C}_{2}=\left\{\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}\right\},\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}\right\}, \\
& \mathrm{C}_{3}=\left\{\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\},\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\},\left\{\mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}\right\}, \\
& \mathrm{C}_{4}=\left\{\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{5}\right\},\left\{\mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{5}, \mathrm{x}_{6}\right\},\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\},\left\{\mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}\right\} \\
& \left.\mathrm{U} / \mathrm{D}=\left\{\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\},\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}\right\},\left\{\mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}\right\}\right\}
\end{aligned}
$$

where, $\Delta_{\mathrm{i}}=\Delta_{\mathrm{xi}}, \mathrm{P}_{\mathrm{i}}$ là $\mathrm{P}_{\mathrm{xi}}$ (for short)

## Step 1:

$\Delta_{1}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}\right\}, \Delta_{2}=\left\{\mathrm{x}_{2}\right\}, \Delta_{3}=\left\{\mathrm{x}_{2}, \mathrm{x}_{3}\right\}$,
we have $\mathrm{d}\left(\Delta_{1}\right)=\mathrm{d}\left(\Delta_{2}\right)=\mathrm{d}\left(\Delta_{3}\right)=1$, because $\Delta_{1}, \Delta_{1}, \Delta_{1} \subseteq\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \Delta_{4}=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}\right\}, \Delta_{5}=\left\{\mathrm{x}_{5}\right\}$, $\Delta_{6}=\left\{\mathrm{x}_{5}, \mathrm{x}_{6}\right\}$,
we have $\mathrm{d}\left(\Delta_{4}\right)=\mathrm{d}\left(\Delta_{5}\right)=\mathrm{d}\left(\Delta_{6}\right)=2$, because $\Delta_{4}, \Delta_{5}, \Delta_{6} \subseteq\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}\right\}, \Delta_{7}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}\right\}, \Delta_{8}=\left\{\mathrm{x}_{8}\right\}, \Delta_{9}=\left\{\mathrm{x}_{8}, \mathrm{X}_{9}\right\}$ we have $\mathrm{d}\left(\Delta_{7}\right)=\mathrm{d}\left(\Delta_{8}\right)=\mathrm{d}\left(\Delta_{9}\right)=3$, because $\Delta_{7}, \Delta_{8}, \Delta_{9} \subseteq\left\{\mathrm{x}_{7}, \mathrm{X}_{8}, \mathrm{X}_{9}\right\}$

$$
\mathrm{CI}=9 \Rightarrow \mathrm{~S} \text { is consistent }
$$

## Step 2:

$$
\begin{align*}
& \mathrm{P}-\left\{\mathrm{C}_{1}\right\}: \\
& \mathrm{P}_{1}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}\right\}, \mathrm{P}_{2}=\left\{\mathrm{x}_{2}\right\}, \mathrm{P}_{3}=\left\{\mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \\
& \mathrm{P}_{4}=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}\right\}, \mathrm{P}_{5}=\left\{\mathrm{x}_{5}\right\}, \mathrm{P}_{6}=\left\{\mathrm{x}_{5}, \mathrm{x}_{6}\right\}, \\
& \mathrm{P}_{7}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}\right\}, \mathrm{P}_{8}=\left\{\mathrm{x}_{8}\right\}, \mathrm{P}_{9}=\left\{\mathrm{x}_{8}, \mathrm{X}_{9}\right\} \\
& \qquad \sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(\mathrm{P}_{x i} \cap P_{x j}\right)| | d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right) \mid=0\right. \tag{21}
\end{align*}
$$

$$
\Delta=\Delta-\left\{\mathrm{C}_{1}\right\}=\left\{\mathrm{C}_{2}, \mathrm{C}_{3}, \mathrm{C}_{4}\right\} .
$$

## Step 3:

$$
\begin{align*}
& \mathrm{P}=\Delta-\left\{\mathrm{C}_{2}\right\} \\
& \mathrm{P}_{1}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}\right\}, \mathrm{P}_{2}=\left\{\mathrm{x}_{2}\right\}, \mathrm{P}_{3}=\left\{\mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \\
& \mathrm{P}_{4}=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}\right\}, \mathrm{P}_{5}=\left\{\mathrm{x}_{5}\right\}, \mathrm{P}_{6}=\left\{\mathrm{x}_{5}, \mathrm{x}_{6}\right\}, \\
& \mathrm{P}_{7}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}\right\}, \mathrm{P}_{8}=\left\{\mathrm{x}_{8}\right\}, \mathrm{P}_{9}=\left\{\mathrm{x}_{8}, \mathrm{x}_{9}\right\} \\
& \sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(P_{x i} \cap P_{x j}\right)| | d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right) \mid=0\right.  \tag{22}\\
& \qquad \Delta=\Delta-\left\{\mathrm{C}_{2}\right\}=\left\{\mathrm{C}_{3}, \mathrm{C}_{4}\right\}
\end{align*}
$$

## Step 4:

$$
\begin{align*}
\mathrm{P}= & \Delta-\left\{\mathrm{C}_{3}\right\}: \\
\mathrm{P}_{1} & =\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{5}\right\}, \mathrm{P}_{2}=\left\{\mathrm{x}_{2}\right\}, \mathrm{P}_{3}=\left\{\mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{5}, \mathrm{x}_{6}\right\}, \\
\mathrm{P}_{4} & =\left\{\mathrm{x}_{4}, \mathrm{x}_{5}\right\}, \mathrm{P}_{5}=\left\{\mathrm{x}_{5}\right\}, \mathrm{P}_{6}=\left\{\mathrm{x}_{5}, \mathrm{x}_{6}\right\}, \\
\mathrm{P}_{7} & =\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{7}, \mathrm{x}_{8}\right\}, \mathrm{P}_{8}=\left\{\mathrm{x}_{5}, \mathrm{x}_{8}\right\}, \mathrm{P}_{9}=\left\{\mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\} \\
& \sum_{x i \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(\mathrm{P}_{x i} \cap P_{x j}\right)\left|d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right)\right| \neq 0\right. \tag{23}
\end{align*}
$$

(we can see $\left(\Delta_{1} \cap \Delta_{4}\right)=\varnothing$, but $\left.\left(\mathrm{P}_{1} \cap \mathrm{P}_{4}\right) \neq \varnothing,\left|\mathrm{d}\left(\Delta_{1}\right)-\mathrm{d}\left(\Delta_{4}\right)\right| \neq 0\right)$

$$
\Delta=\left\{\mathrm{C}_{3}, \mathrm{C}_{4}\right\} .
$$

Step 5 :

$$
\begin{align*}
\mathrm{P} & =\Delta-\left\{\mathrm{C}_{4}\right\} \\
\mathrm{P}_{1}= & \left.=\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \mathrm{P}_{2}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \mathrm{P}_{3}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}, \\
\mathrm{P}_{4} & =\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}, \mathrm{P}_{5}=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}, \mathrm{P}_{6}=\left\{\mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6}, \mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\} \\
\mathrm{P}_{7} & =\left\{\mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}, \mathrm{P}_{8}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\}, \mathrm{P}_{9}=\left\{\mathrm{x}_{7}, \mathrm{x}_{8}, \mathrm{x}_{9}\right\} \\
& \sum_{\mathrm{xi} \in U} \sum_{x j \in U} \mid\left(\Delta_{x i} \cap \Delta_{x j} \cup\left(P_{x i} \cap P_{x j}\right)\left|\| d\left(\Delta_{x i}\right)-d\left(\Delta_{x j}\right)\right| \neq 0\right. \tag{24}
\end{align*}
$$

(we can see $\left(\Delta_{6} \cap \Delta_{7}\right)=\varnothing$, but $\left(\mathrm{P}_{6} \cap \mathrm{P}_{7}\right) \neq \varnothing$, $\left|\mathrm{d}\left(\Delta_{6}\right)-\mathrm{d}\left(\Delta_{7}\right)\right| \neq 0$ )

$$
\Delta=\left\{\mathrm{C}_{3}, \mathrm{C}_{4}\right\} .
$$

## Step 6:

$R D=\left\{C_{3}, C_{4}\right\}$ is reduct. i.e attributes with respect to $C_{1}, C_{2}$ are deleted.

## 5. Conclusion

In this paper, we propose an attribute reduction algorithm. It based on results of Chen Degang et al in consistent and inconsistent covering decision system. The time complexity of this algorithm is $\mathrm{O}\left(\left|\Delta\left\|\|\left.\right|^{2}\right)\right.\right.$. Compare with the results of Cheng Degang's the algorithm, our result is compatible. In next time, we are studying algorithms which are developed from the theory of traditional rough sets.
