# THE ELEMENTARY METHOD OF CONSTRUTHCTION THE RIGHT POLYGONS 

Diana Vashakmadze<br>tamazvashakmadze@yahoo.com

We remind (see e.g.[1],ch.III), that in the investigation of problems of geometric (by a ruler and compasses) on construction of right polygon C.F.Gauss proved, that construction of the right " p -gons" (for prime members) is possible if and only if p is the number of type $\mathrm{p}=2^{2^{n}}+1$.

Below we give the way of construction of right polygon for arbitrary number p.
Let $\mathrm{OA}=\mathrm{r}$ be a radius of a circle (with O center).We mark points $\mathrm{M}_{\mathrm{i}},(\mathrm{i}=1, \ldots, \mathrm{p}$ ) along the arch
from $\mathrm{A}=\mathrm{M}_{0}$ with equal distance from each other. Possibility of this division is evident. Now we consider the sector $\mathrm{OM}_{0} \mathrm{M}_{\mathrm{p}}$. If we form a spatial convex figure compressing sides $\mathrm{OM}_{0}$ and $\mathrm{OM}_{\mathrm{p}}$ we construct the circular with length of the circle in the base of which is $\mathrm{M}_{0} \mathrm{M}_{\mathrm{p}}$ curve of sector. The points $M_{0}, M_{1}, \ldots, M_{p-1}, M_{p}=M_{0}$ form right " $p$-gon".
